The EPO's experience in machine learning /automation

Machine Learning in pre-classification Routing files

Routing of files is done based on CPC or IPC (3 streams)

50%

Classifications provided by other offices ie. CPC, IPC

50%

Intellectual preclassification
36%, quality 91%

Automatic preclassification
(Auto-Precla tool)
64%, quality 91%

Auto-Preclassification

- To find the appropriate Technical Team: around 1400 CPC ranges
- Auto-Precla: analysing incoming applications and allocating a classification symbol for automated routing
- Taxonomy Engine provided by commercial company

Auto-Preclassification

XML of
DESC, CLMS, ABS

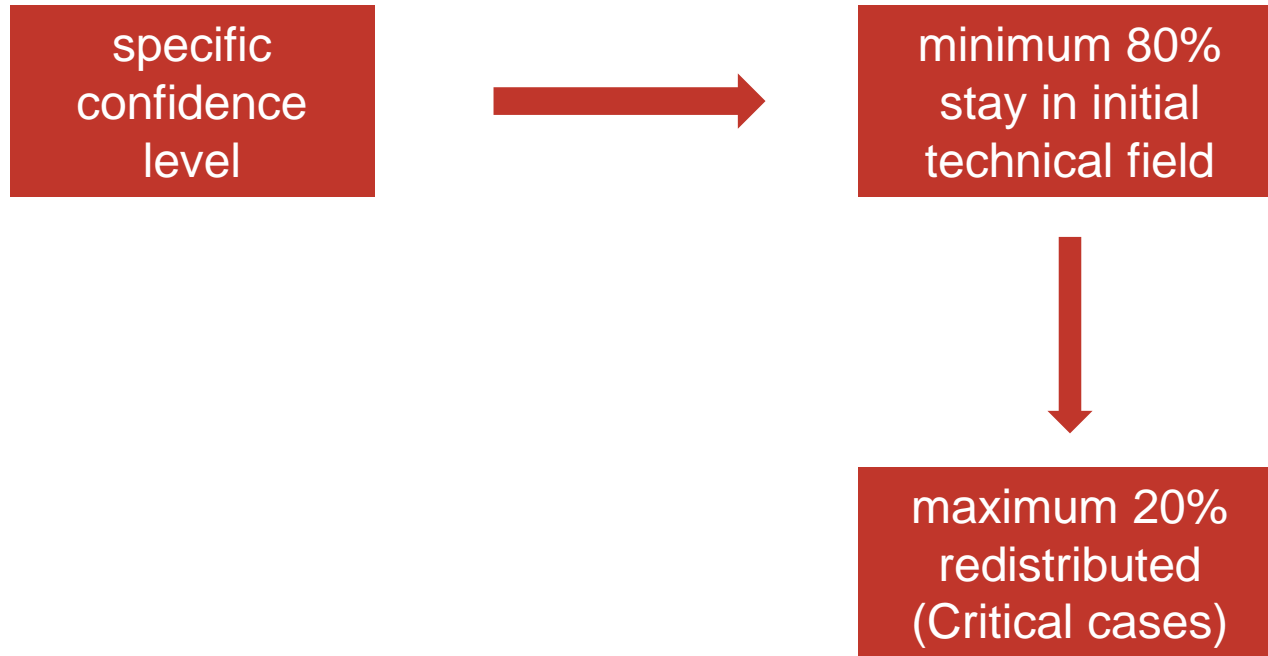

+
title
+

reference to cited prior art

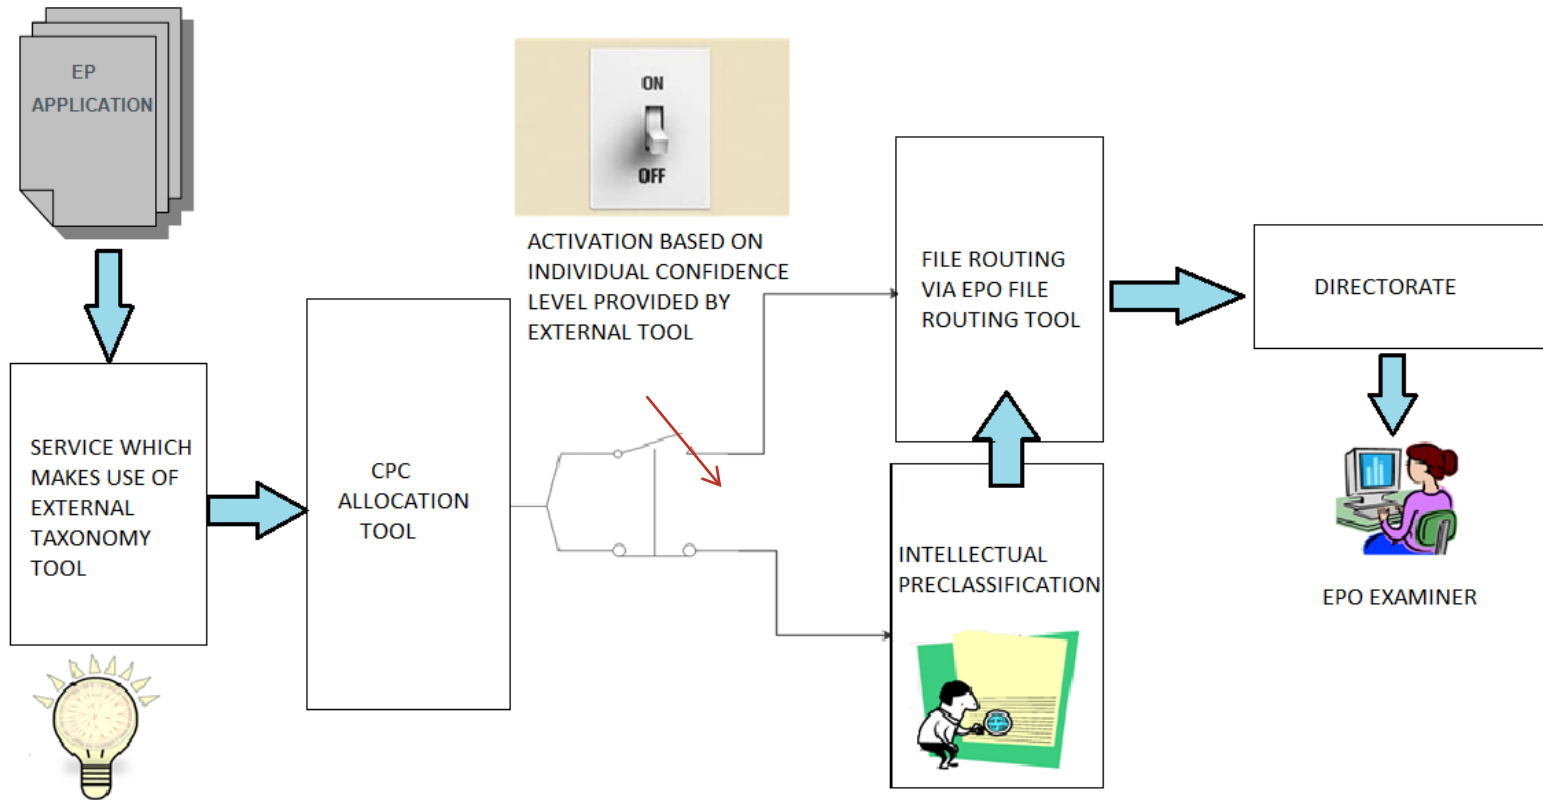

3 proposed classification symbols
with corresponding confidence levels

When to validate a CPC range

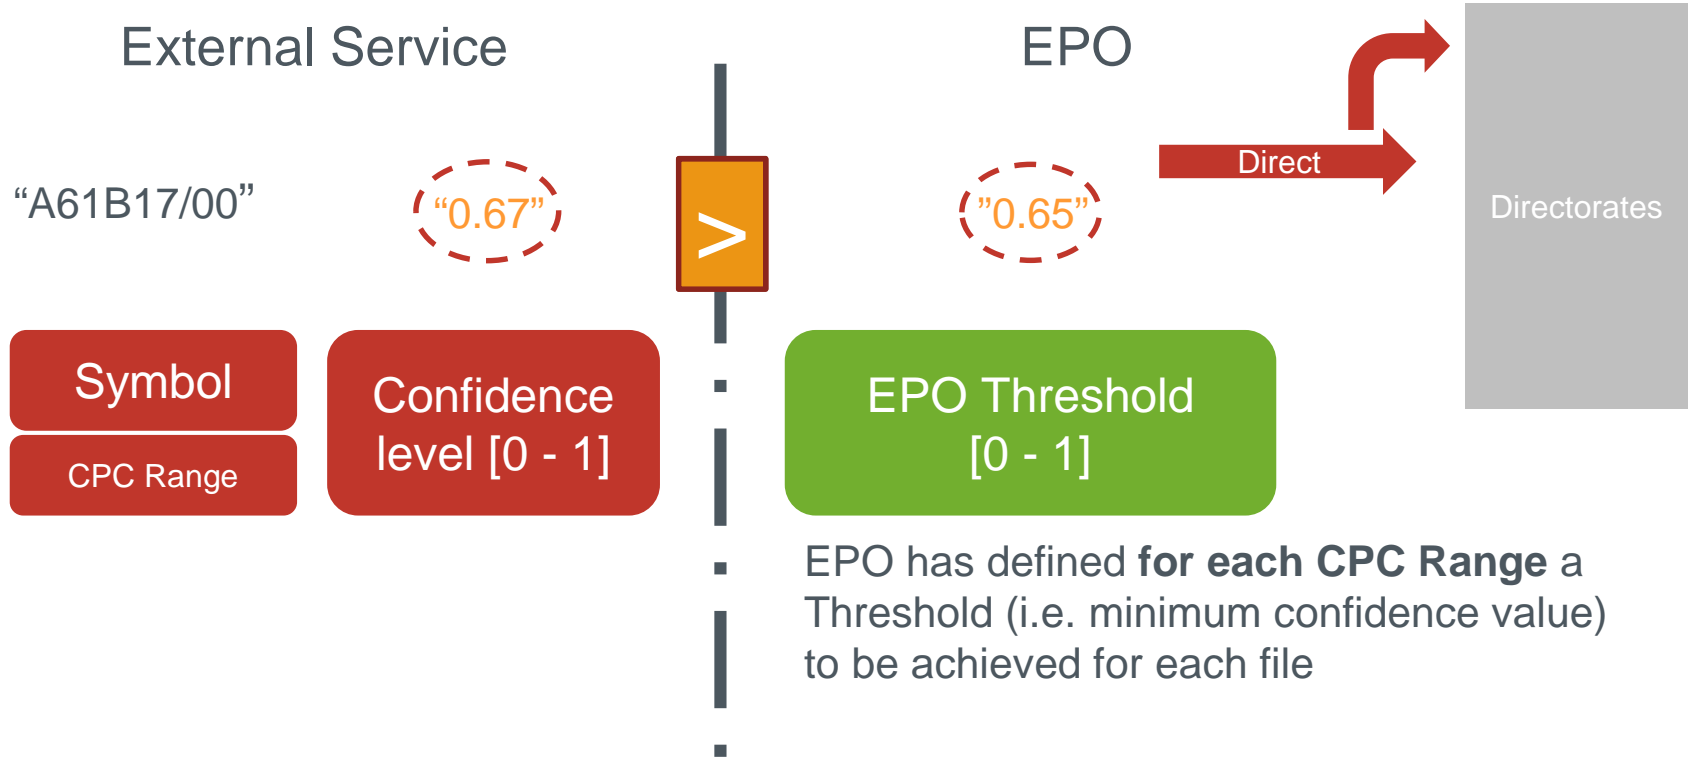

Training material: millions of documents classified in CPC

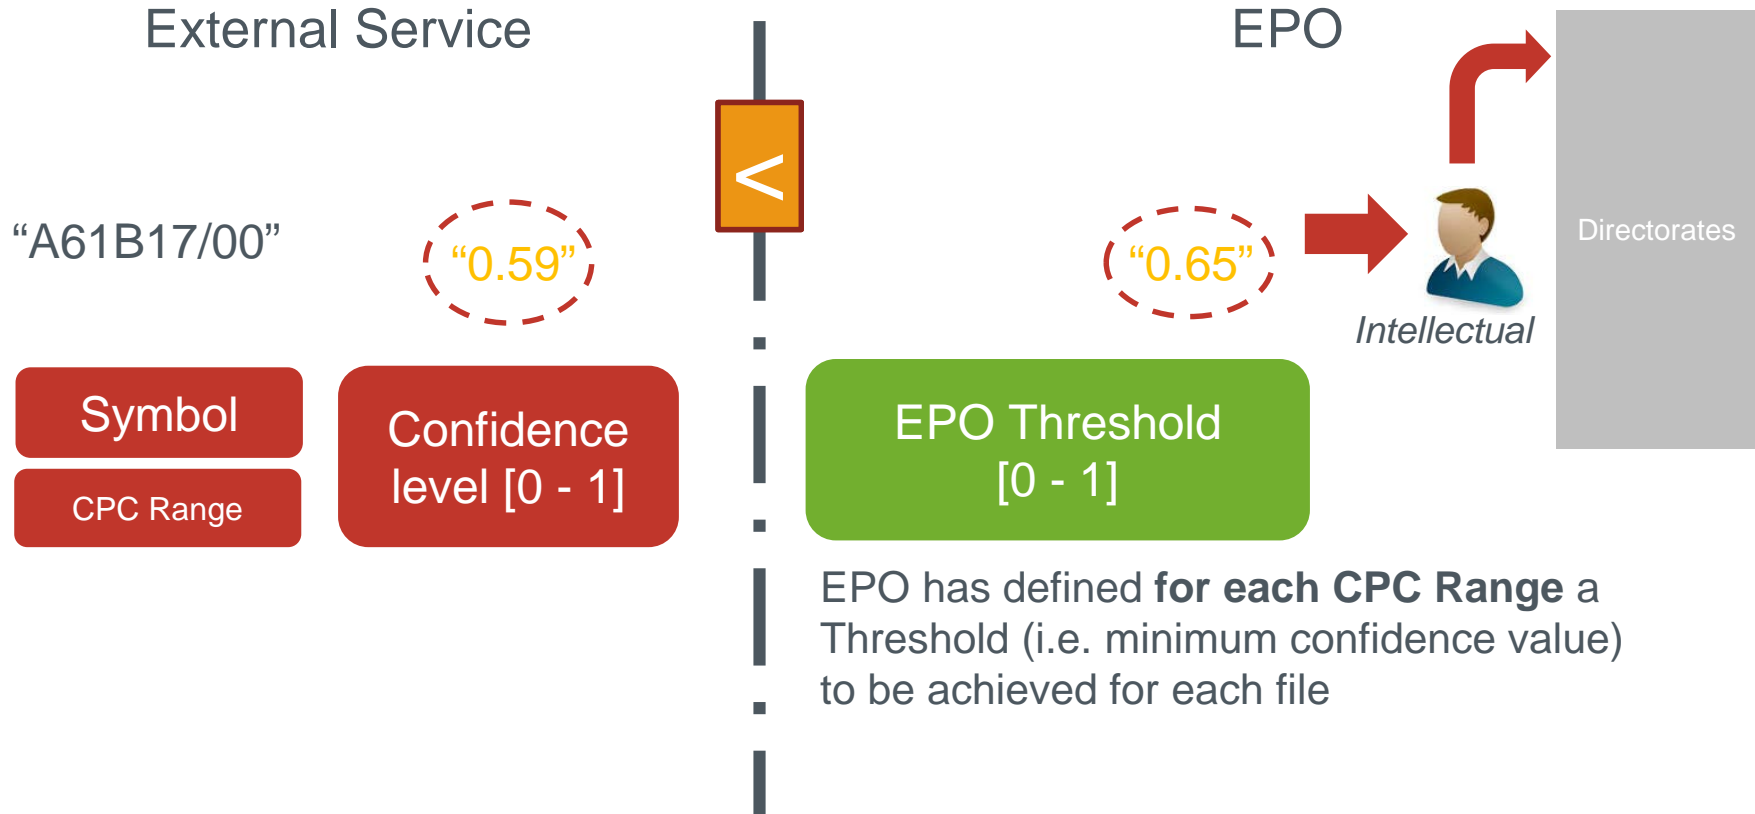

CPC Range “switches”

AutoPrec

AutoPrec

Automation in reclassification of documents in CPC (Auto-Recla service)

Load “Standard files” delivered by CPC revision process: Modified RCL, TRL, Quality

Modified “RCL” (Revision Concordance List)

QF (Quality File)

To be achieved quality in %	93,5
Acceptable missed symbol(s)	0
Acceptable superfluous symbol(s)	1

Workflow

Quality of Auto-Recla

- Mandatory monitoring of quality!
- Achieved quality according to requirements set by Classification Quality Nominee

Machine Learning in Classification

Classification

- More difficult than pre-classification or reclassification
- All relevant symbols necessary for the search to be allocated (Invention and Additional symbols)
- Pre-class: 1400 ranges
- Classification: 260.000 symbols
- Choosing the right Artificial Intelligence software for classification

Machine Learning for Classification: 3 progressive levels

- Level 1: Artificial Intelligence only as support to the examiner/classifier
- Level 2: Artificial Intelligence as partial replacement to human classification
- Level 3: Artificial Intelligence as major replacement to human classification

Pilot of adding Machine Learning CPC symbols to documents classified in other patent offices

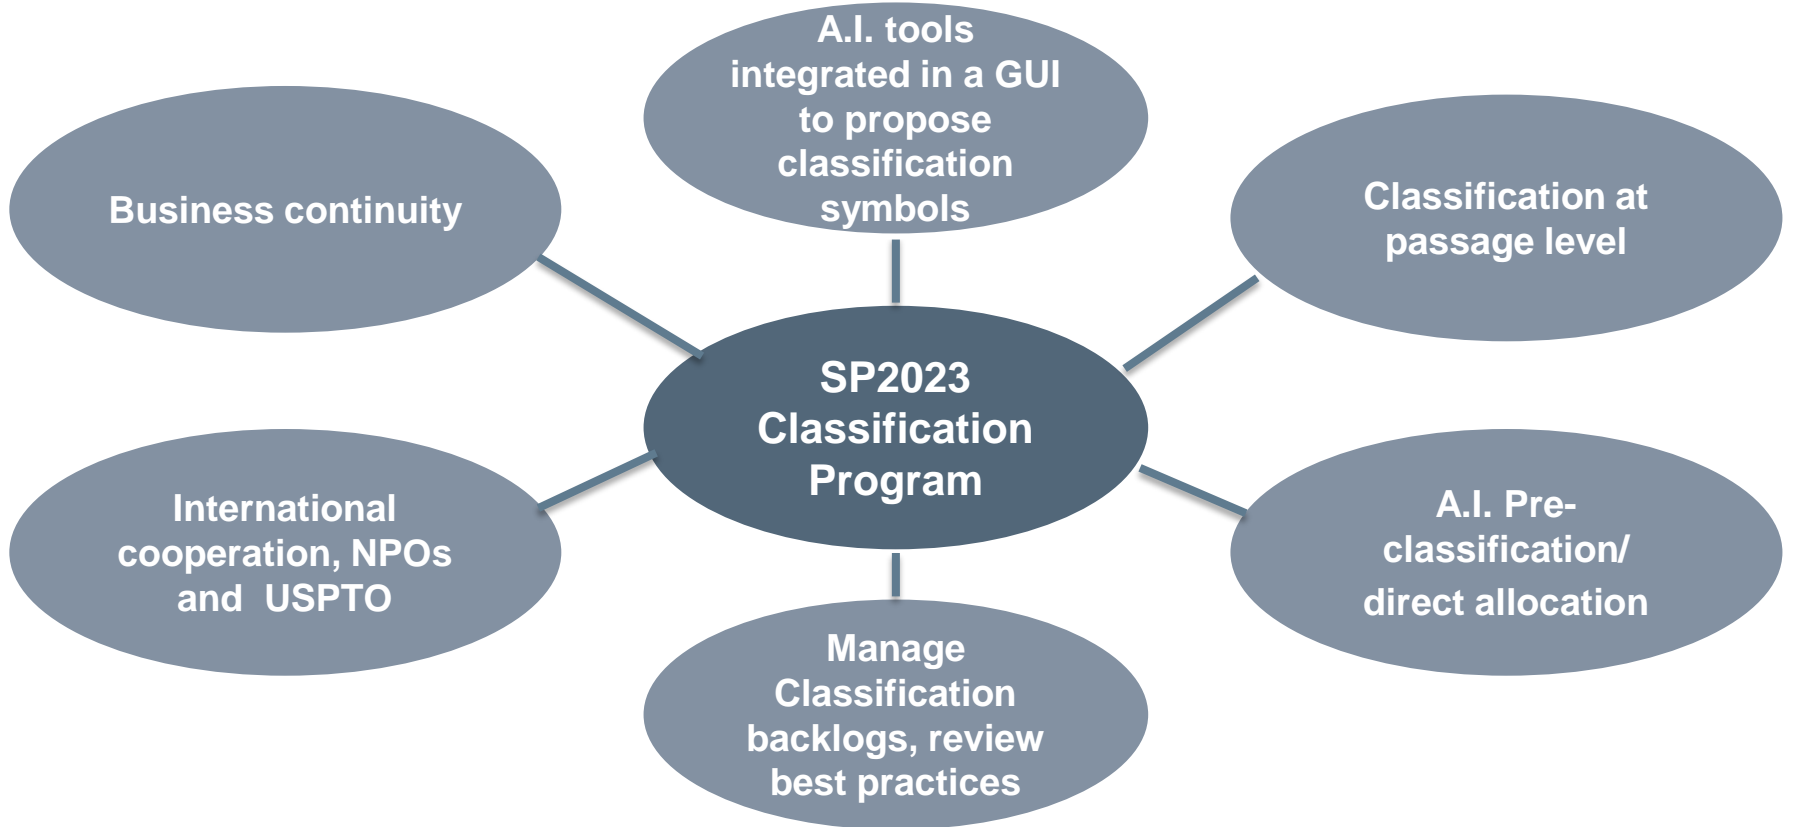

- In 21 technical fields
- Set of documents classified and previously checked by the Quality Nominee (QN)
- Machine Learning added 3 extra CPC symbols
- The set of documents with initial symbols + 3 extra symbols sent again to QN for quality check
- Comparison of results
- Outcome:
 - Increase of completeness
 - Some deterioration of correctness (noise)

Strategic Plan 2023

▪ Master the Prior Art - Classification

Strategic Plan 2023: Classification

Thank you!
